

Northwind Analytics - Company Overview

(Fictional company. Sample document for the RAG demo.)

About Orion

Orion is Northwind's self-service analytics platform. It lets non-technical teams connect data sources, build dashboards, and schedule reports without writing SQL. Orion is a managed cloud service and needs only a web browser.

Data Sources

Orion connects to PostgreSQL, MySQL, BigQuery, Snowflake, and any REST API that returns JSON. CSV and Excel files can be uploaded directly. Connections to production databases are read-only unless an administrator grants write access.

Access Control

Orion uses role-based access control with three roles: Viewer, Editor, and Administrator. Viewers read dashboards, Editors build and modify them, and Administrators manage data connections, users, and billing. Access is scoped per workspace.

Pricing

Orion has three plans. Free supports up to 3 users and 2 data sources. Standard supports up to 25 users with hourly data refresh. Enterprise offers unlimited users, 5-minute refresh, single sign-on, and priority support. Pricing is per active user per month, billed annually.

Working at Northwind

Northwind is remote-first with flexible hours. Core collaboration hours are 11:00 to 15:00 local time. Employees accrue 25 days of paid annual leave per year and receive an annual learning budget of 1,500 units for courses and conferences.
